## Methods

### AgNPs Synthesis

Ethanol (70%) tincture of flowers *Calendula off.* production LLP "Pharmacy 2010", Kazakhstan, Karaganda; silver nitrate 99 % and aqueous solution of ammonia (25 %) LabChemProm(Almaty, Kazakhstan) were used without preliminary treatment. AgNPs were synthesized according to previously reported method with some modifications[1]. A solution of 1 mM silver nitrate was mixed with the ethanol (70%) plant extract of *Calendula off.* flowers, diluted with purified water in a ratio of 1:50. The plant extract was used as a stabilizer and reducing agent. The final concentration of the reaction mixture was: 1% alcohol tincture of *Calendula off.* and 0.008% silver nitrate and the pH was adjusted to 9 by ammonia solution. Then that reaction mixture was left under sunlight for approximately 48h and the obtained AgNPs suspension was stored at + 4 °C.

### Characterization of physical properties of cryogels

Physical properties of the cryogels were evaluated using the following equations.

Swelling ratio:

$$SR = \frac{W_t}{W_d} \times 100\% \quad \text{eq.S1}$$

Water uptake:

$$WU = \frac{(W_t - W_d)}{W_d} \times 100 \quad \text{eq.S2}$$

Porosity:

$$P = \left(1 - \frac{d_0}{d_3}\right) \times 100 \quad \text{eq.S3}$$

- Where  $W_t$  and  $W_d$  represent the weights of the hydrogel in swollen state at time  $t$ , and respectively in dried state;
- $W_e$  is the weight of swollen hydrogel at equilibrium;
- $d_0$  is the density of the dried cross-linked polymer and  $d_3$  is the density of the equilibrium swollen cross-linked polymer.

## Results

**Figure S1** FTIR spectra of dry samples of: CHI in native state, freeze dried CHI dissolved in acetic acid and cryogel CHI-GA.

Record Number: 1	Dispersant RI: 1,330
