

Gradient Elution and operating conditions by RP-HPLC-DAD-ESI-QTOF-MS/MS

The gradient elution was conducted according [10,22] with two mobile phases, 0.5% acetic acid, *v/v* (phase A) and acetonitrile (phase B), with a constant flow rate of 0.5 mL min⁻¹. The gradient program was as follows: 0 min 99% A and 1% B, 5.50 min 93% A and 7% B, 11 min 86% A and 14% B, 17.5 min 76% A and 24% B, 22.50 min 60% A and 40% B, 27.50 min 0% A and 100% B, 28.5 min 0% A and 100% B, 29.5 min. For column equilibration, initial conditions were finally maintained for 5.50 min. (total run 35 min). The injection volume was 15 μ L. Briefly, the operating conditions were: drying nitrogen gas temperature 325 °C with a flow of 10 L min⁻¹; nebulizer pressure 20 psig; sheath gas temperature 400 °C with a flow 12 L min⁻¹; capillary voltage 4000 V; nozzle voltage 500 V; fragmentor voltage 130 V; skimmer voltage 45 V; octapole radiofrequency voltage 750 V.

Data acquisition (2.5 Hz) in profile mode was governed via MassHunter Workstation software (Agilent technologies). The spectra were acquired in the negative ionization mode, over a mass-to-charge (*m/z*) range from 70 to 1100. The detection window was set to 100 ppm. Reference mass correction on each sample was performed with a continuous infusion of Agilent TOF biopolymer analysis mixture containing trifluoroacetic acid ammonium salt (*m/z* 112.9856) and hexakis (1H, 1H, 3H-tetrafluoropropoxy) phosphazine (*m/z* 980.0164 corresponding to the acetic adduct).

Table S1. Phenolic compounds characterized in SG32 oil.
