Figure S1. Structural alignment of the homology model of the PCI_Lip (grey) and *Candida rugosa* lipase 2 (PDB ID 1GZ7, magenta). The carbon atoms of the catalytic triad are colored in green for the PCI or in magenta for the 1GZ7, the nitrogen atoms are blue and the oxygen atoms are colored in red. The backbone of the entrance of the active pocket is marked in red.

Figure S2. Sequence alignment of the PCI_Lip and *Candida rugosa* lipase 2 (PDB ID 1GZ7), the catalytic triad was confirmed as S213, E339 and H449 (numbering according to the PCI_Lip), which corresponds to the residues S209 (red box), E341 (blue box) and His449 (magenta box) and the oxy-anion hole is marked in green box (G126-G128).

Figure S3. Analysis of the substrate tunnel by displaying the cavities around the nucleophilic S213 (marked in magenta), whereas the lid regions are marked in red. Tunnel restricting residues are colored in cyan. F91 is a special residues, as it is inside the lid region as well as forming part of the substrate entry tunnel.

Figure S4. Docking of different chain length *p*-nitrophenol (pNP) esters inside the homology model of the PCI_Lip. Only the best docking results are shown. The criteria of a meaningful docking result is the distance of the S213 towards the carboxyl carbon atom, which were set to be < 5.1 Å for pNPA, 4.9 Å for pNPB, 4.6 Å for pNPV, 4.5 Å for pNPH, 4.5 Å for pNPO Å and 4.3 Å for pNPP. The carbon

atoms of the protein are colored in green, the nitrogen atoms are blue and the oxygen atoms are colored in red. The carbon atoms of the *p*-nitrophenol (pNP) esters are colored in orange. (A) pNP-acetate (pNPA), (B) pNP-butyrate (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH), (E) pNP-octanoate (pNPO), and (F) pNP-palmitate (pNPP). HSE = prototropic tautomer of histidine, H on N2 in the histidine ring, according to the CHARMM force field.

Figure S5. 2D pattern analysis of the docking of different chain length *p*-nitrophenol (pNP) esters inside the homology model of the PCI_Lip generated by using the software LigPlot. Only the best docking results are shown. The residues of the protein which are in the interacting distance are marked with red half circles, the carbon atoms of the *p*-nitrophenol (pNP) esters are colored in orange. (A) pNP-acetate (pNPA), (B) pNP-butyrate (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH), (E) pNP-octanoate (pNPO), and (F) pNP-palmitate (pNPP). HSE = prototropic tautomer of histidine, H on N2 in the histidine ring, according to the CHARMM force field.

Table S2. Analysis of the free binding energy from the PCI_Lip WT and all exchanges at position F91 for the docking results of pNPA. The empty unit means that substrates couldn't be docked into the active pocket. Affinity at best position means the docking affinity at the minimum distance.

Mutant	Number of meaningful docking results	Minimum distance [Å]	Affinity at best position [kcal/mol]	Highest affinity [kcal/mol]

Figure S6. Docking of different chain length *p*-nitrophenol (pNP) esters inside the L305A mutant of the PCI_Lip. Only the best docking results are shown. The criteria of a meaningful docking result is the distance of the S213 towards the carboxyl carbon atom, which were set to be <5.1 Å for pNPA, 4.9 Å for pNPB, 4.6 Å for pNPV, 4.5 Å for pNPH, 4.5 Å for pNPPO Å and 4.3 Å for pNPP. The carbon atoms of the protein are colored in green, the nitrogen atoms are blue and the oxygen atoms are colored in red. The carbon atoms of the *p*-nitrophenol (pNP) esters are colored in orange. (A) pNP-acetate (pNPA), (B) pNP-butyrates (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH) and (E) pNP-octanoate (pNPPO). HSE = prototropic tautomer of histidine, H on N2 in the histidine ring, according to the CHARMM force field.

Figure S7. 2D pattern analysis of the docking of different chain length *p*-nitrophenol (pNP) esters inside the L305A mutant of the PCI_Lip generated by using the software LigPlot. Only the best docking results are shown. The residues of the protein which are in the interacting distance are marked with red half circles. The carbon atoms of the *p*-nitrophenol (pNP) esters are colored in black and the bonds in magenta, the nitrogen atoms are blue and the oxygen atoms are colored in red. (A) pNP-acetate (pNPA), (B) pNP-butyrate (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH) and (E) pNP-octanoate (pNPO). HSE = prototropic tautomer of histidine, H on N2 in the histidine ring, according to the CHARMM force field.

Figure S8. Docking of different chain length *p*-nitrophenol (pNP) esters inside the L302G mutant of the PCI_Lip. Only the best docking results are shown. The criteria of a meaningful docking result is the distance of the S213 towards the carboxyl carbon atom, which were set to be <5.1 Å for pNPA, 4.9 Å for pNPB, 4.6 Å for pNPV, 4.5 Å for pNPH, 4.5 Å for pNPO Å and 4.3 Å for pNPP. The carbon atoms of the protein are colored in green, the nitrogen atoms are blue and the oxygen atoms are colored in red. The carbon atoms of the *p*-nitrophenol (pNP) esters are colored in orange. (A) pNP-acetate (pNPA), (B) pNP-butyrates (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH), (E) pNP-octanoate (pNPO), and (F) pNP-palmitate (pNPP). HSE = prototropic tautomer of histidine, H on N2 in the histidine ring, according to the CHARMM force field.

Figure S9. 2D pattern analysis of the docking of different chain length *p*-nitrophenol (pNP) esters inside the L302G mutant of the PCI_Lip generated by using the software LigPlotT. Only the best docking results are shown. The residues of the protein which are in the interacting distance are marked with red half circles. The carbon atoms of the *p*-nitrophenol (pNP) esters are colored in black and the bonds in magenta, the nitrogen atoms are blue and the oxygen atoms are colored in red. (A) pNP-acetate (pNPA), (B) pNP-butyrates (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH), (E) pNP-octanoate (pNPO), and (F) pNP-palmitate (pNPP). HSE = prototropic tautomer of histidine, H on N2 in the histidine ring, according to the CHARMM force field.

Figure S10. Docking of different chain length *p*-nitrophenol (pNP) esters inside the F91L mutant of the PCI_Lip. Only the best docking results are shown. The criteria of a meaningful docking result is the distance of the S213 towards the carboxyl carbon atom, which were set to be <5.1 Å for pNPA, 4.9 Å for pNPB, 4.6 Å for pNPV, 4.5 Å for pNPH, 4.5 Å for pNPO Å and 4.3 Å for pNPP. The carbon atoms of the protein are colored in green, the nitrogen atoms are blue and the oxygen atoms are colored in red. The carbon atoms of the *p*-nitrophenol (pNP) esters are colored in orange. (A) pNP-acetate (pNPA), (B) pNP-butyrate (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH), (E) pNP-octanoate (pNPO), and (F) pNP-palmitate (pNPP). HSE = prototropic tautomer of histidine, H on N2 in the histidine ring, according to the CHARMM force field.

Figure S11. 2D pattern analysis of the docking of different chain length *p*-nitrophenol (pNP) esters inside the F91L mutant of the PCI_Lip generated by using the software LigPlot. Only the best docking results are shown. The residues of the protein which are in the interacting distance are marked with red half circles. The carbon atoms of the *p*-nitrophenol (pNP) esters are colored in black and the bonds in magenta, the nitrogen atoms are blue and the oxygen atoms are colored in red. (A) pNP-acetate (pNPA), (B) pNP-butyrate (pNPB), (C) pNP-valerate (pNPV), (D) pNP-hexanoate (pNPH), (E) pNP-octanoate (pNPO), and (F) pNP-palmitate (pNPP).

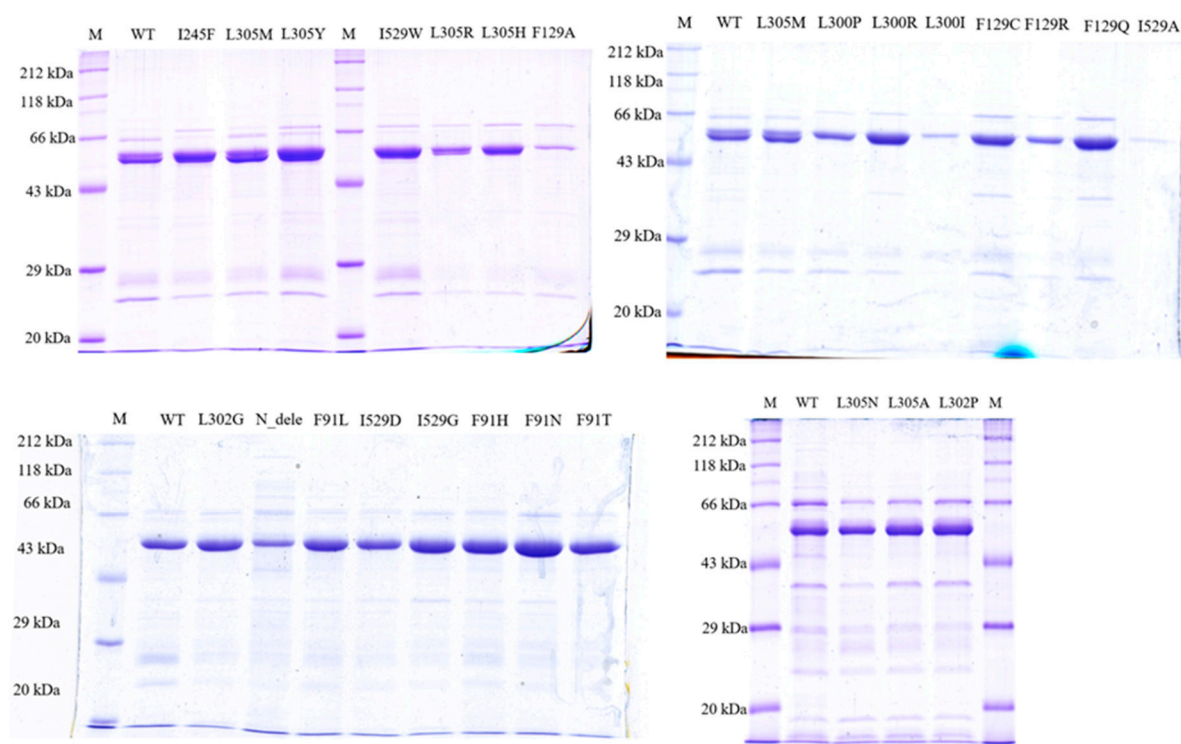

Figure S12. Denaturing SDS-PAGE gels of the IMAC fractions of all expressed PCI_Lip mutants.

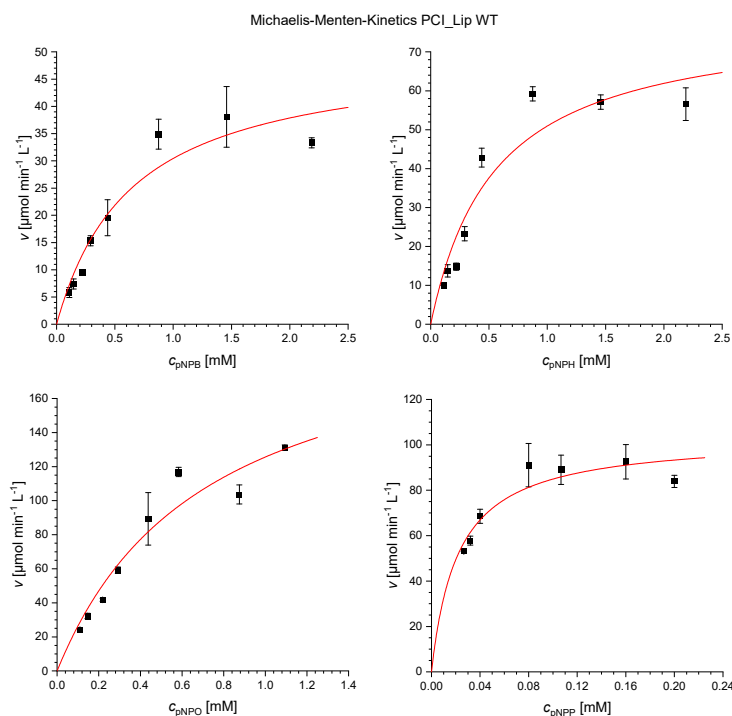

Figure S13. Saturation curves of PCI_Lip WT against selected pNP-Esters (pNPB, pNPH, pNPO and pNPP). Obtained data for the activity were fitted via OriginPro® 2021 based on the Michaelis-Menten equation. In case of pNPB, pNPH and pNPO saturation was not achieved due to a limited solubility of these substrates under the assay conditions. Activity at all concentrations were measured in triplicates and the error bars correspond to standard deviation.

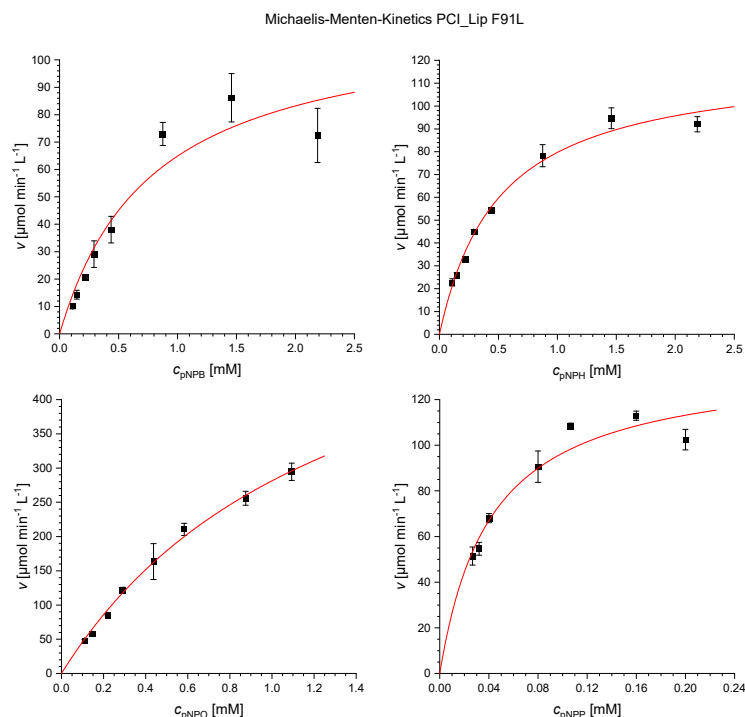

Figure S14. Saturation curves of PCI_Lip mutant F91L against selected pNP-Esters (pNPB, pNPH, pNPO and pNPP). Obtained data for the activity were fitted via OriginPro® 2021 based on the Michaelis-Menten equation. In case of pNPB, pNPH and pNPO saturation was not achieved due to a limited solubility of these substrates under the assay conditions. Activity at all concentrations were measured in triplicates and the error bars correspond to standard deviation.

Figure S15. Saturation curves of PCI_Lip mutant L302G against selected pNP-Esters (pNPB, pNPH, pNPO and pNPP). Obtained data for the activity were fitted via OriginPro® 2021 based on the

Michaelis-Menten equation. In case of pNPB, pNPH and pNPO saturation was not achieved due to a limited solubility of these substrates under the assay conditions. Activity at all concentrations were measured in triplicates and the error bars correspond to standard deviation.

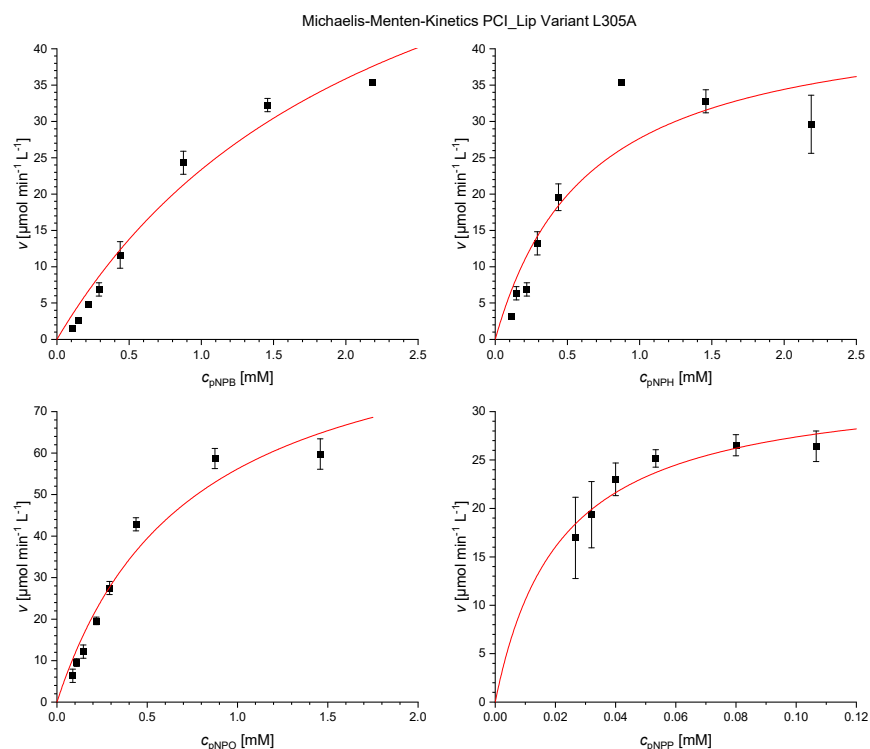

Figure S16. Saturation curves of PCI_Lip mutant L305A against selected pNP-Esters (pNPB, pNPH, pNPO and pNPP). Obtained data for the activity were fitted via OriginPro® 2021 based on the Michaelis-Menten equation. In case of pNPB, pNPH and pNPO saturation was not achieved due to a limited solubility of these substrates under the assay conditions. Activity at all concentrations were measured in triplicates and the error bars correspond to standard deviation.

Table 50. Calculated T_{50}^{60} values and errors for the PCI_Lip WT, F91L, L302G and L305A.

	T_{50}^{60} [°C]
WT	31.5 ± 0.7
F91L	29.8 ± 3.2
L302G	32.9 ± 1.1
L305A	33.5 ± 0.5

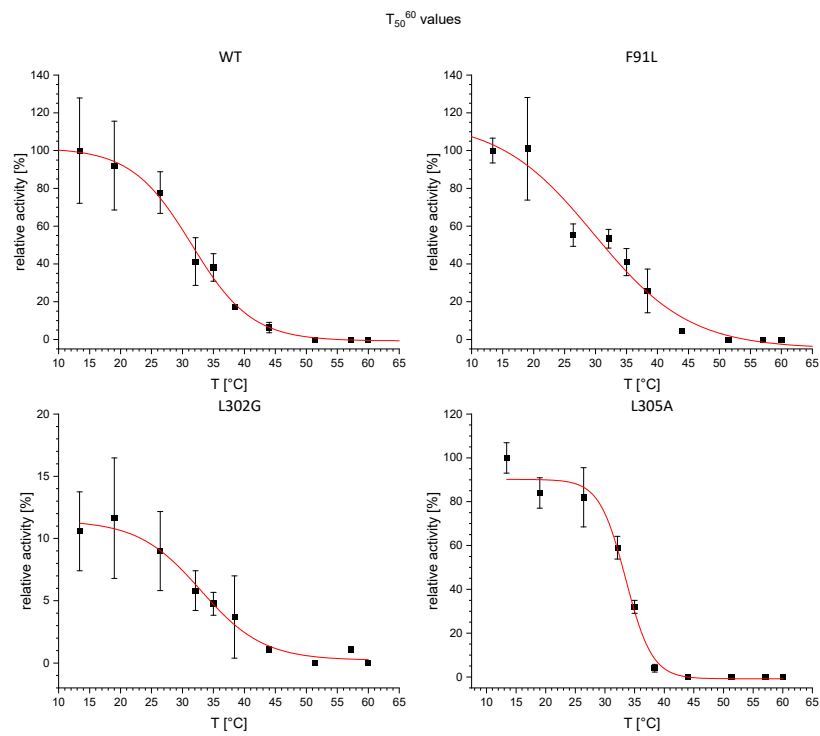

Figure S17. Activities of PCI_Lip WT and mutants F91L, L302G and L305A after incubation for 1 h at different temperatures against pNPO. The activity data was fitted via OriginPro® 2021 using a Boltzman-fit. The turning point of the fitted curve represents the T_{50}^{60} value of the respective PCI_Lip mutant. The T_{50}^{60} value represents the temperature where after a treatment of 1 h 50% of the enzymes activity is lost.

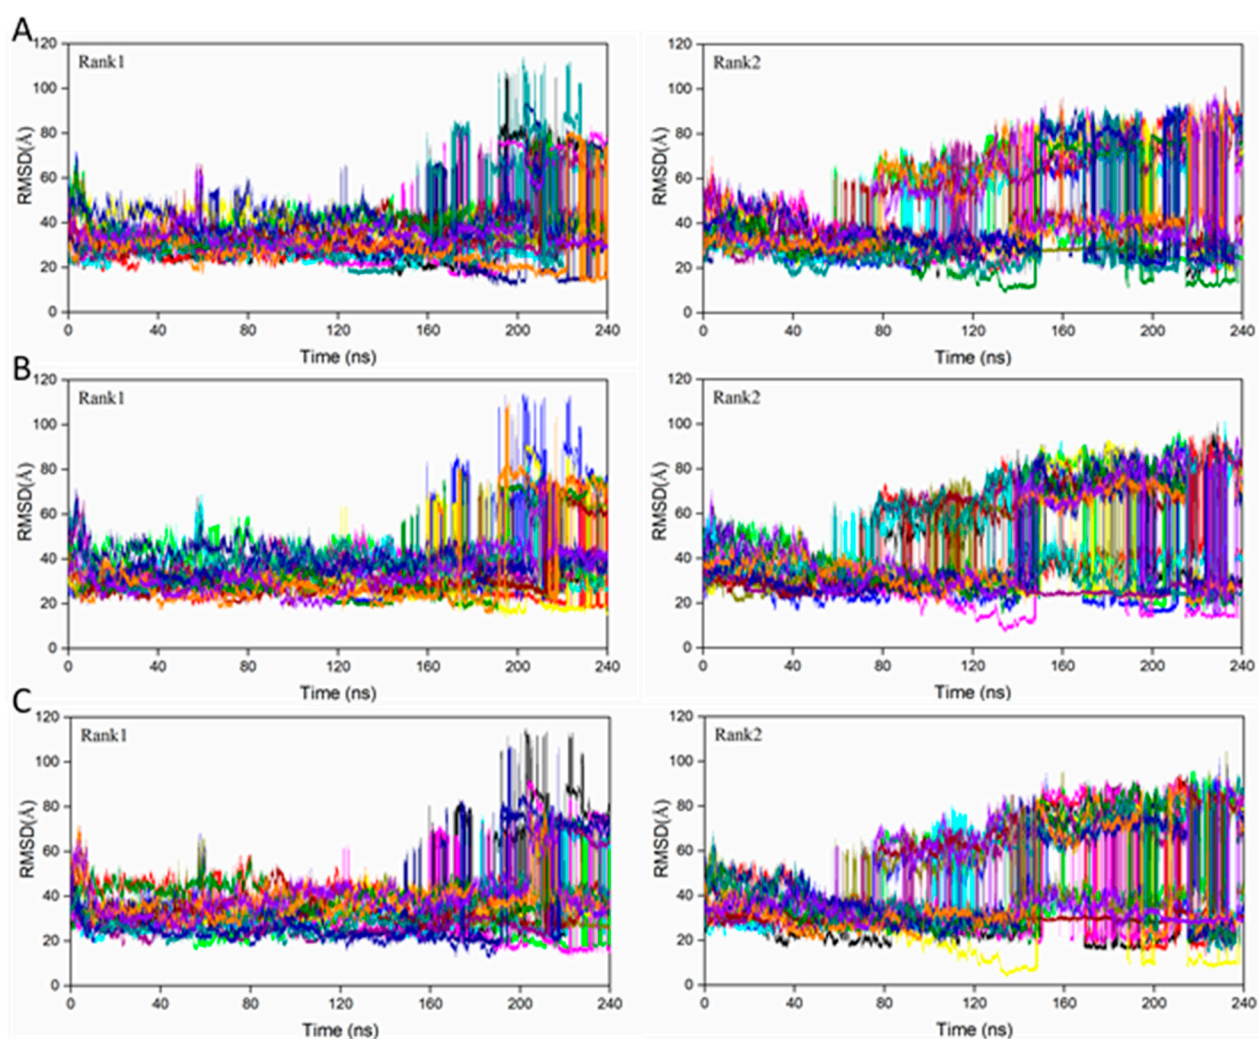

Figure S18. Time resolution of RMSD for wild type PCI_Lip. (A) C10:0; (B) C6:0; (C) C16:0.

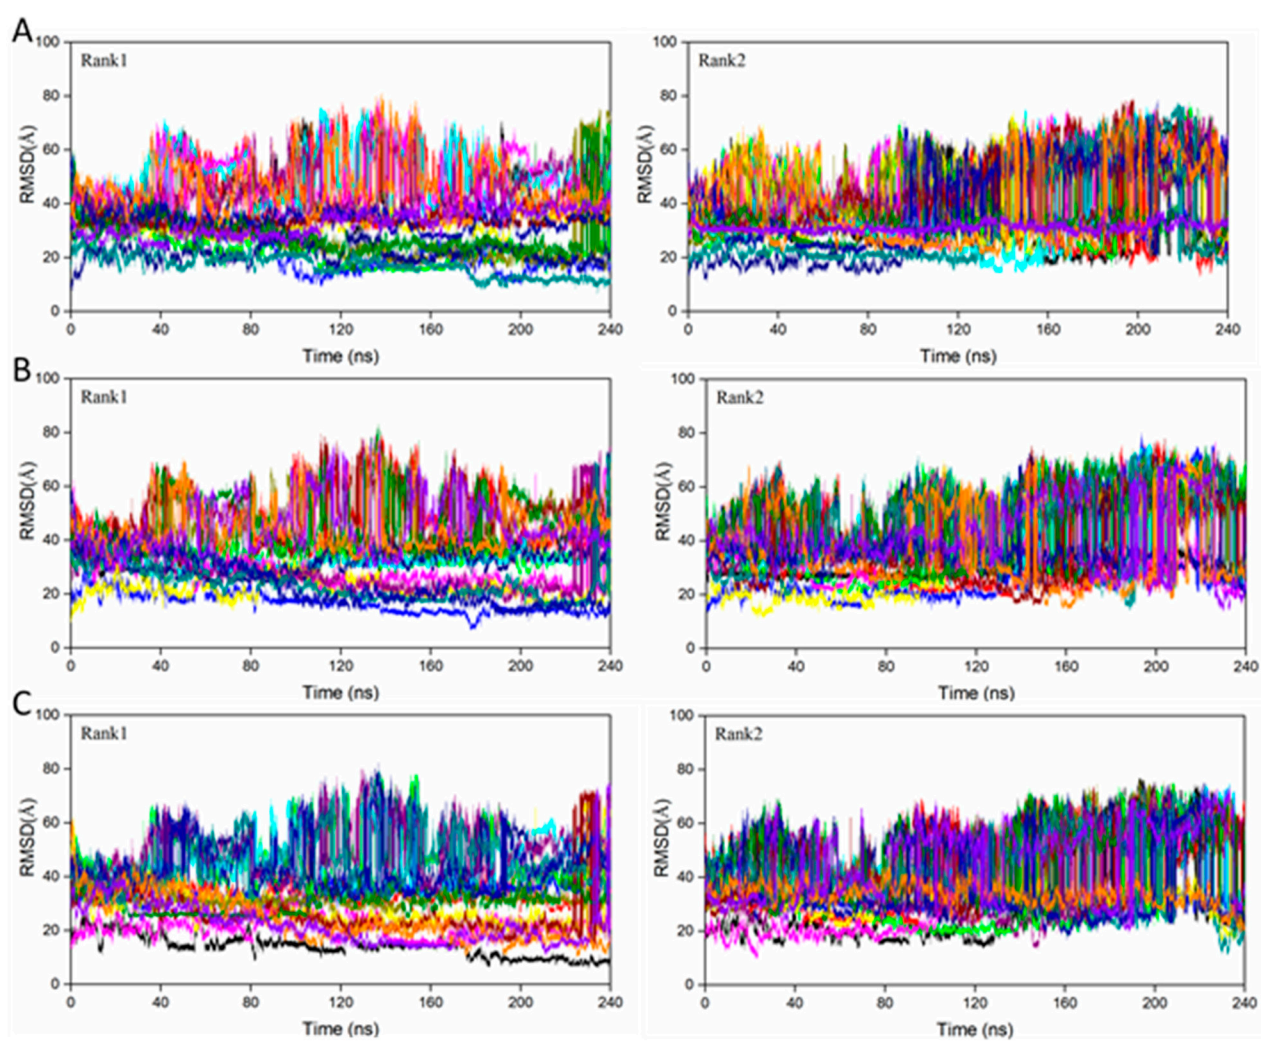

Figure S19. Time resolution of RMSD for L305A mutant of PCI_Lip. (A) C10:0; (B) C6:0; (C) C16:0.

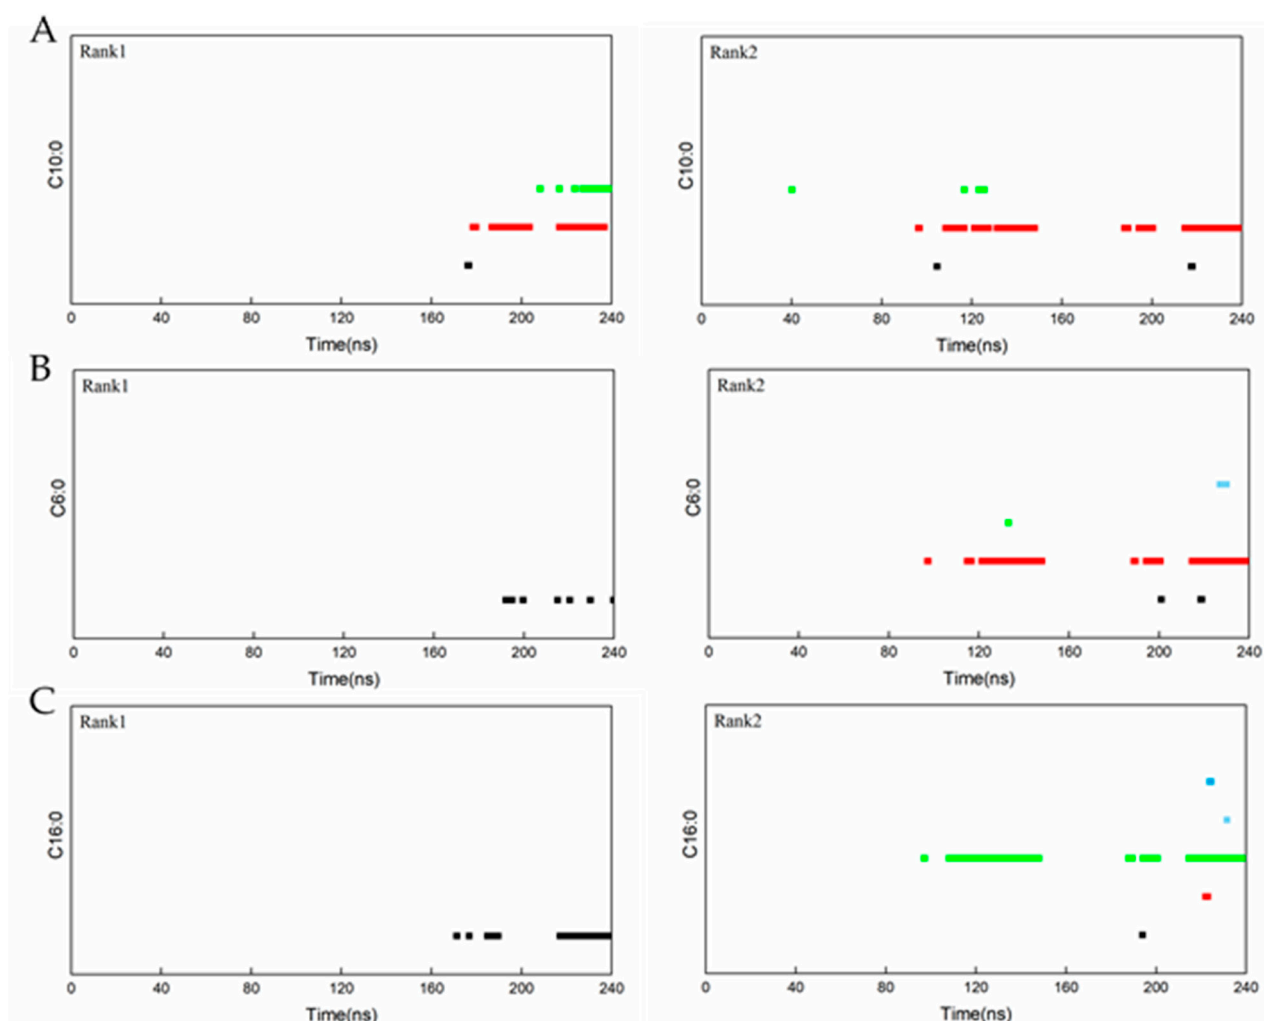

Figure S20. The binding time distribution of fatty acids which could enter the active pocket for wild type PCI_Lip. A kind of color represented one binding time distribution of one fatty acid chain entering the active pocket. (A) C10:0; (B) C6:0; (C) C16:0.

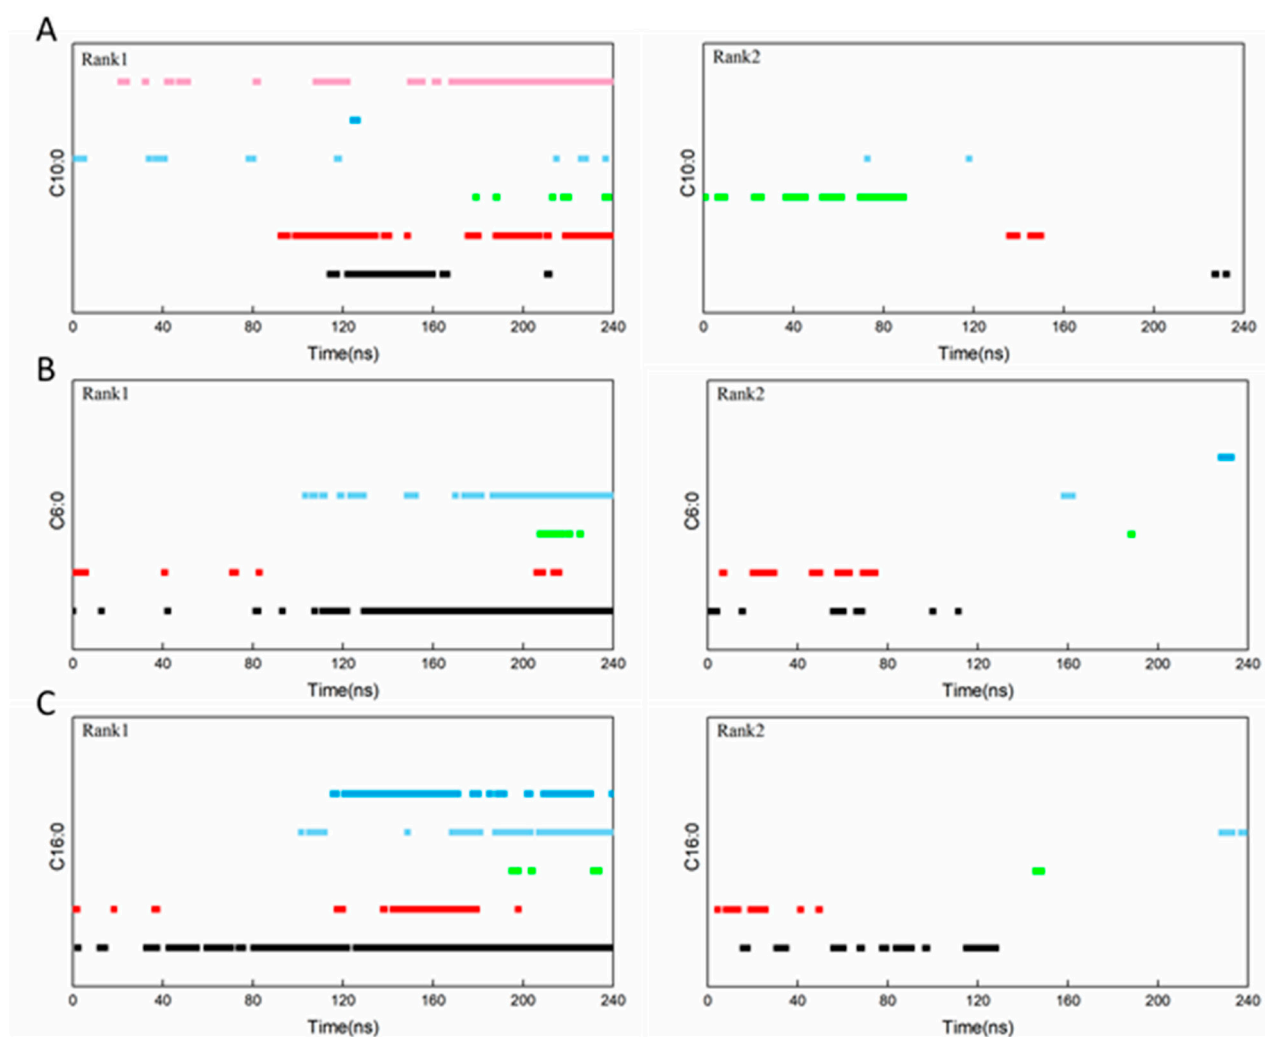

Figure S21. The binding time distribution of fatty acids which could enter the active pocket for L305A mutant of PCI_Lip. A kind of color represented one binding time distribution of one fatty acid chain entering the active pocket. (A) C10:0; (B) C6:0; (C) C16:0.

Table S51. The number and binding time of the fatty acid chains entering the active center of wild type PCI_Lip.

	Fatty acid chain	No.1	No.2
Number	C10:0	3	3
	C6:0	1	4
	C16:0	3	5
Total binding time	C10:0	24.36	43.86
	C6:0	0.42	41.45
	C16:0	4.47	60.12

Table S52. The number and binding time of the fatty acid chains entering the active center of L305A.

	Fatty acid chain	No.1	No.2
Number	C10:0	6	4
	C6:0	4	5
	C16:0	5	4
Total binding time	C10:0	117.6	8.51
	C6:0	130.05	10.86
	C16:0	209.1	11.98
