**Figure S1.** Rarefaction curves of the OTU number for each sample.

CNA - infection with *C. militaris*, K - control, 15 and 25 - temperature °C, cadavers - bacterial decomposed larvae.

**Table S1.** List and description of genes and primers sequences used in the qPCR.

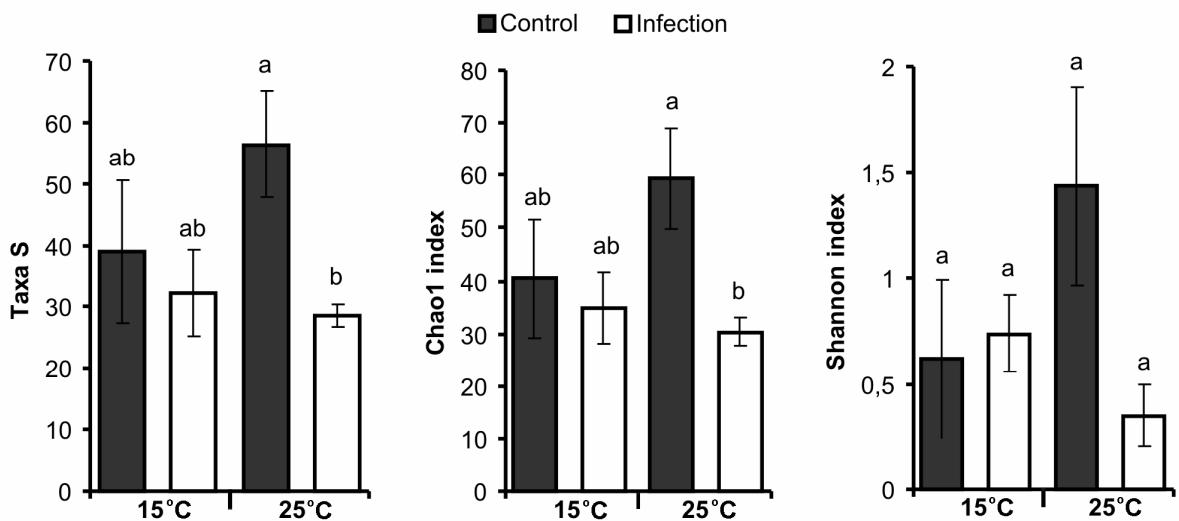

| Gene Name                                    | NCBI genebank Accession number | Gene symbol | Primer sequence (5' – 3')                                 | Product size (bp) | PCR efficiency ( $\pm$ SD)           | Tm in qPCR, °C | Primers source                                   |

<sup>b</sup> Melo et al., *PlosOne*, Dataset, (2013). [10.1371/journal.pone.0078905](https://doi.org/10.1371/journal.pone.0078905)

<sup>c</sup> Primers were designed in the Laboratory of Insect Pathology ISEA SB RAS with an online resource, <https://www.ncbi.nlm.nih.gov/tools/primer-blast/>, and their properties were estimated by IDT OligoAnalyzer 3.1 (<http://eu.idtdna.com/calc/analyzer>).

**Figure S2.** Diversity indexes of bacterial communities in midgut of wax moth larvae at 96 h post injection of *C. militaris* (2500 conidia per larva) and the incubation under 15°C and 25°C .Indexes were calculated for OTU level. Different letters indicate significant differences between treatments (Dunn's test, P < 0.05).

**Figure S3.** Wax moth larvae overgrowing with *B. bassiana* (A) and *M. robertsii* (B) at four day after injection with 2,500 conidia per larva and incubation under 25°C.
