a) Precise cationic concentrations obtained by mixing **P2** with **P1**, b) gel obtained by mixing **P2** and **P3** in a 50:50 ratio, c) concentration of the functional groups in  $\mu\text{mol}$  per  $\text{mg}$  gel, d) measured in triplicates in water, dry weight obtained by freeze-drying fully swollen gels, e) rheology measurements of fully swollen gels in water done in triplicates with a frequency of 1 Hz and a deformation of 1%, f) measured in a 1 mM KCl solution with a concentration of 1  $\text{mg}/\text{mL}$  of free polymer at  $\text{pH}=7$ -8 and 25  $^\circ\text{C}$ . Mean value derived from 10 measurements. For different TMAEA concentrations a mixed solution of **P1** and **P2** with a final polymer concentration of 1  $\text{mg}/\text{mL}$  is used, g) RGD gels were formed in 10wt% solutions while other gels were formed in 18wt% solutions.
