

Table S1. Source and Biotype of native *S. cerevisiae* strains. Biotype combination coming from the match of both profiles delta12/21 and ISSR. In particular, combining delta12/21 profile (I) and ISSR profile (I) it was obtained the Biotype I; in the same way, delta12/21 profile (II) and ISSR profile (I) it was obtained the Biotype II; delta12/21 profile (II) and ISSR profile (IV) it was obtained the Biotype III; delta12/21 profile (I) and ISSR profile (III) it was obtained the Biotype IV; delta12/21 profile (IV) and ISSR profile (I) it was obtained the Biotype V; delta12/21 profile (I) and ISSR profile (IV) it was obtained the Biotype VI; delta12/21 profile (III) and ISSR profile (I) it was obtained the Biotype VII; delta12/21 profile (V) and ISSR profile (I) it was obtained the Biotype VIII; delta12/21 profile (VI) and ISSR profile (II) it was obtained the Biotype IX.

Sampling year	Source of <i>S. cerevisiae</i> isolates	Isolates code	Biotype combination	delta12/21 profile	ISSR profile

Figure S1. Electrophoresis gels of native *S. cerevisiae* strains. (a) represents the different biotypes (I, II, III, IV, V, VI) obtained by δ12-21 analyses. (b) represents the different biotypes (I, II, III, IV) obtained by ISSR-PCR. In both agarose gels, the lane indicated as 100bp represents the molecular weight marker.
