

Supplementary Materials: Impact of *Pseudomonas* sp. SVB-B33 on Stress- and Cell Wall-Related Genes in Roots and Leaves of Hemp under Salinity

Roberto Berni, Jean-Francois Hausman, Silas Villas-Boas * and Gea Guerriero *

Figure S1. Images of roots from plants grown under control/salt stress conditions in the absence/presence of living or dead bacteria. The scale bar is 5 cm.

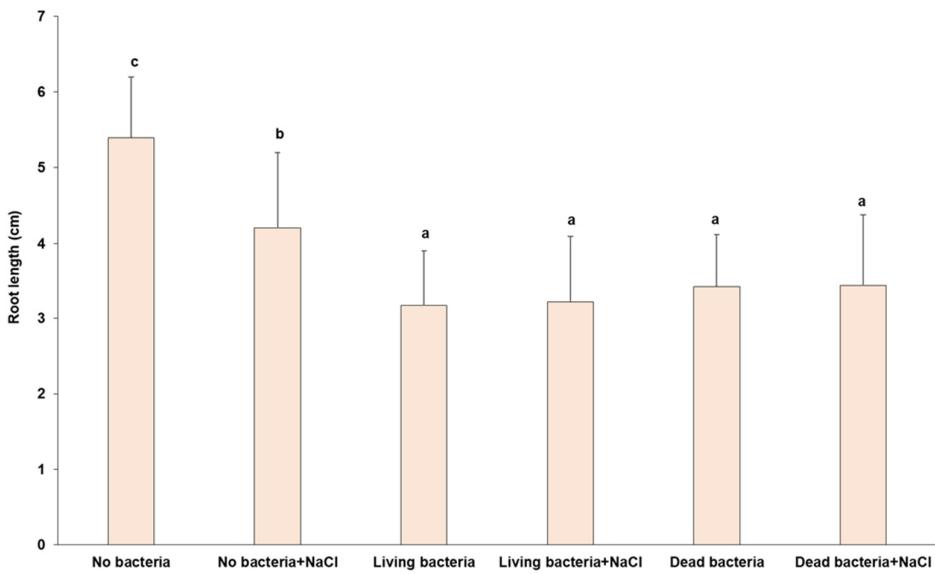

Figure S2. Length of roots from plants grown under control/salt stress conditions in the absence/presence of living or dead bacteria. Different letters indicate statistically significant values ($p < 0.05$). Statistical parameters: $\chi^2(5) = 73.534$, $p = 0.000$.

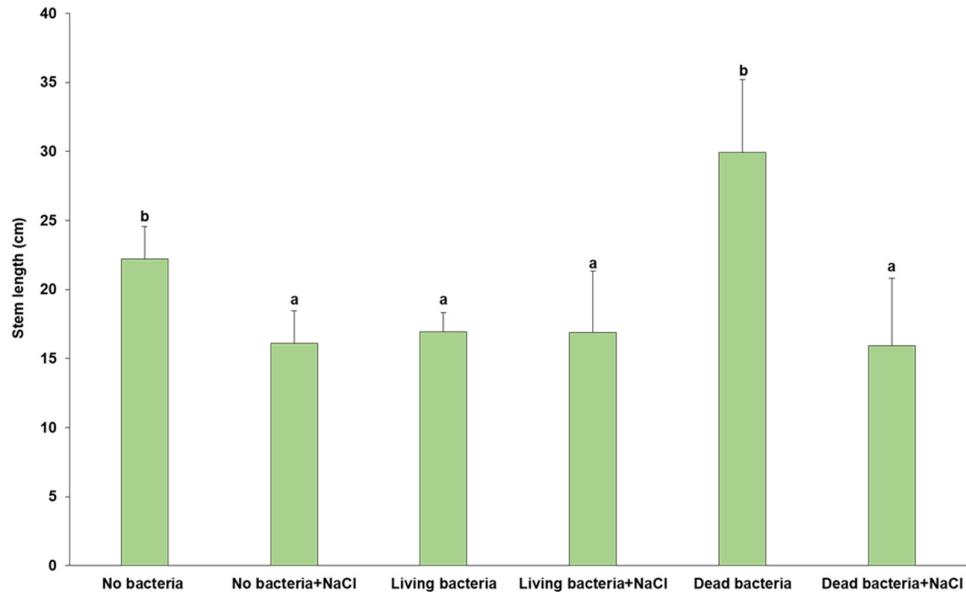

Figure S3. Length of stems from plants grown under control/salt stress conditions in the absence/presence of living or dead bacteria. Different letters indicate statistically significant values ($p < 0.05$). Statistical parameters: $\chi^2(5) = 43.845$, $p = 0.000$.

Table S1. Table showing the statistical parameters of Figure 5. Degree of freedom (df), F or X^2 value and significance (p). A parametric test (ANOVA one-way followed by the Tukey's post-hoc test) was applied for normal and homogeneous data, otherwise a non-parametric test (Kruskal-Wallis together with the Dunn's post-hoc test.) was performed.

Roots			
Parametric test
