**Synthesis of 1*H*-benzo[*d*]imidazole-2-thiol 2**

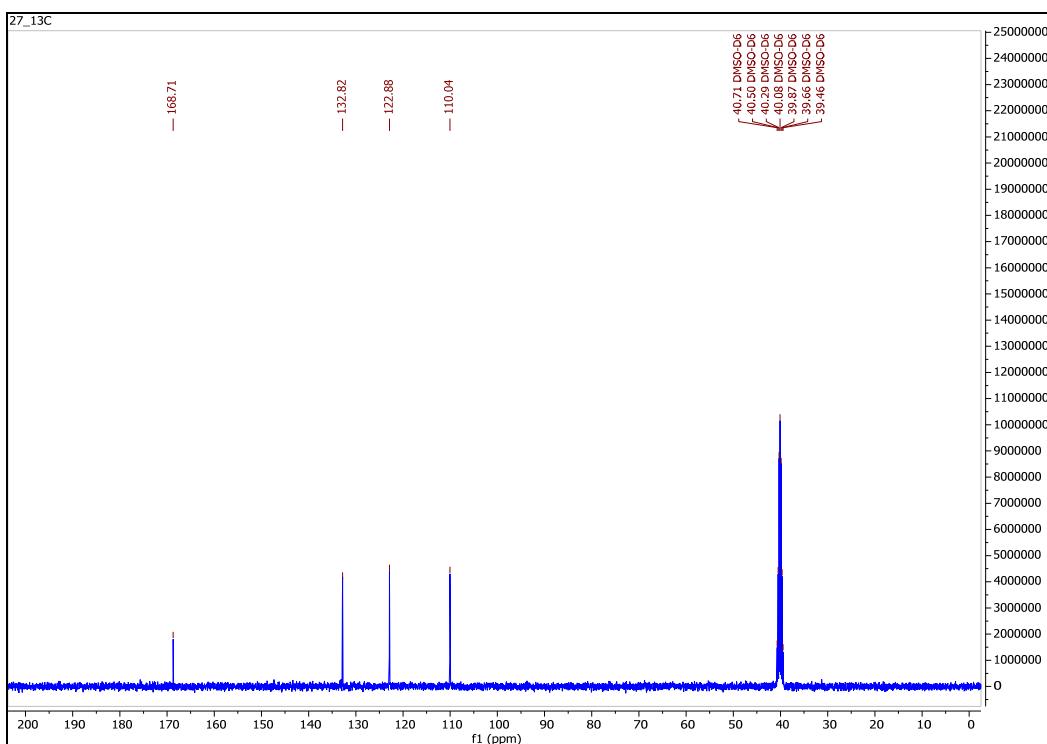

A mixture of (0.1 mol, 10.8 g) of *o*-phenylenediamine **1**, (0.1 mol, 5.65 g) of potassium hydroxide and (0.1 mol, 7.67 g, 6.19 mL) carbon disulfide, in 90 mL of ethanol in a 250 mL round bottom flask was heated under reflux for 3 h. After completion of heating, reaction mixture was cooled down to room temperature. After that, 100 mL of water were added. The mixture was acidified using diluted acetic acid with stirring. The product was collected by filtration and dried overnight. The dried product was recrystallized from ethanol. White crystals were formed in 96% yield.

## Computational Protocol

All calculations were performed using the  $\omega$ B97X-D [1] functional together with the standard 6-311G(d,p) [2] basis set. This functional includes long-range exchange and semi classical London dispersion corrections, and has demonstrated to be an efficient method in the study of organic reactions. [3] The TSs were characterized by the presence of only one imaginary frequency. The Berny method was used in optimizations. [4,5] The intrinsic reaction coordinates (IRC) paths [6] were traced to obtain the energy profiles connecting each TS to the two associated minima in the potential energy surface using the Hratchian-Schlegel Hessian-based Predictor-Corrector integrator. [7-9]

Solvent effects of ethanol in the thermodynamic calculations were taken into account by full optimization of the gas-phase structures at the same computational level using the polarizable continuum model (PCM) [10,11] in the framework of the self-consistent reaction field (SCRF). [12-14] Values of  $\omega$ B97X-D/6-311G(d,p) enthalpies, entropies, and Gibbs free energies in ethanol were calculated with standard statistical thermodynamics at 78 °C and 1 atm [2] by PCM frequency calculations at the solvent-optimized structures.

The GEDT [15] values were computed using the equation  $GEDT(f) = \sum q_f$ , where  $q$  are the natural charges [16,17] of the atoms belonging to one of the two frameworks ( $f$ ) at the TS geometries. Quantum chemical reactivity indices [18,19] were calculated using the equations in reference 19.

The Gaussian 16 suite of programs was used to perform the calculations. [20] Molecular geometries were visualized by using the GaussView program. [21]
