Table 1. The main iso-bioclimatic types, found in the 63 plots of the study area, extracted from the bioclimate map of Sardinia. The code defines the categories in the original vector map of the bioclimates in Sardinia (Italy) [1].

Code	Iso-bioclimatic type
10	Upper Thermomediterranean, Upper Dry, Euoceanic Weak
20	Lower Mesomediterranean, Lower Subhumid, Euoceanic Weak
28	Upper Mesomediterranean, Upper Subhumid, Euoceanic Weak
30	Upper Mesomediterranean, Lower Humid, Euoceanic Weak
31	Upper Mesomediterranean, Lower Humid, Semicontinental Weak
35	Lower Supramediterranean, Lower Humid, Semicontinental Weak
37	Upper Mesotemperate (Submediterranean), Lower Humid, Semicontinental Weak
38	Lower Supratemperate (Submediterranean), Lower Humid, Semicontinental Weak

Table S2. Predictors used in the Generalised linear models (GLMs), along with their detailed description.

Predictors	Detailed description of the predictors (explanatory variables)
Abiotic	pH OC (%): organic carbon. P ₂ O ₅ (ppm): phosphoric anhydride. N (g·kg ⁻¹): nitrogen. Altitude (m a.s.l.): thematic layer produced by GIS analysis from a DEM with 10 × 10 m geometric resolution. Slope: degrees, thematic layer produced by GIS analysis from a DEM with 10 × 10 m geometric resolution. Geological substrate: alluvial, basalt, granite, limestone and schist Fire strength: visually assessed. Classified as absent or very low, low, medium, and high. Iso-bioclimatic types: extracted from the Bioclimate map of Sardinia (Italy)
Biotic	SLU (LU·km ⁻²): spatialized livestock unit pressure. Interpolated maps by livestock unit (LU) and kriging. Trees/shrubs: presence/absence of tree and shrub vegetation in the proximity of plot.
Management	Land managed: (1) by the local Council authority; (2) by FoReSTAS (The Sardinian Forest Agency). SAC: Special Areas of Conservation (https://www.regione.sardegna.it).

Table S3. Floristic list and plant traits.

Table S4. Analysis of variance (ANOVA) was done to test the effect of the number of endemic species (explanatory variable) on species richness, evenness diversity index and pastoral value and, calculated in the 63 sampled plots of the study area.

Response variables	Estimate	Df	Mean Sq	F value	Pr(>F)
Species richness	2.73	1	901.5	18.06	7.45e-05 ***
Evenness	-0.01	1	0.02	8.96	0.003 **
Pastoral value	-0.12	1	1.86	0.05	0.83

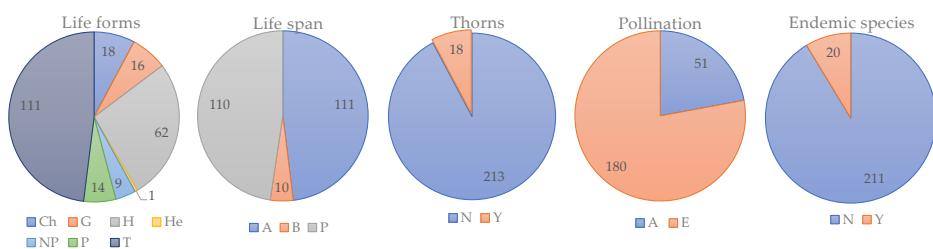

Figure S1. The pie charts show the number of species distributed according to the life forms, life span, presence of thorns, pollination type and the number of endemic species in the 63 sampled plots of the study area. **Life forms** Ch: Chamaephytes, G: Geophytes, H: Hemicryptophytes, He: Helophytes, NP: Nano-phanerophytes, P: Phanerophytes, T: Therophytes. **Life span** A: Annual, B:

Biennial, P: Perennial. **Presence of thorns** Y: Yes, N: No. **Pollination** A: Anemophily, E: Entomophily. **Endemic species** Y: Yes, N: No.

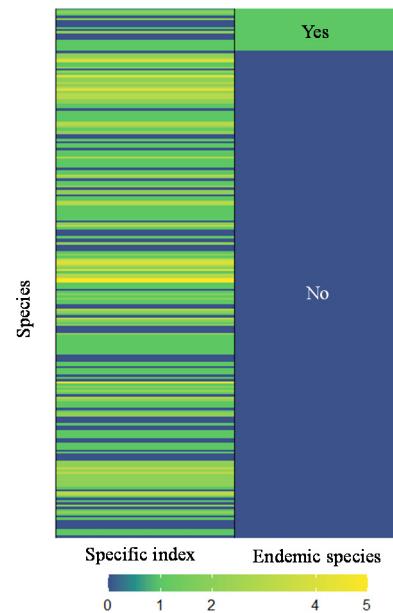

Figure 2. Correlation between the presence of endemic species and the specific index for the evaluation of forage pastoral value (from 0 – species of no forage interest – to 5 – species excellent for quality, palatability and productivity, according to Delpech, 1960).
