

Table S2. Wilcoxon rank sum tests for Quasi-SDE and subcomponents. We failed to reject the H_0 that our study species differed from the other observed frugivores in Quasi-SDE and component values. This suggests that aggregated results for the full complement of species would yield a similar interpretation of *L. subcoriacea* seed dispersal as that generated using our five study species. For Quasi-SDE calculations see Table S1.

Variable	W	p value
Quantity	35 _{5,13}	0.844
Quality	30 _{5,13}	0.844
Quasi-SDE	32.5 _{5,13}	1.000
