#### Abstract

The crystal structures of mononuclear cyclopalladated compounds with phosphine ligands are investigated. The reactions of the five-membered cyclopalladated dinuclear complexes $[\operatorname{Pd}(\mathrm{L})$ $(\mu-\mathrm{Cl})]_{2}$ with the monophosphine ligand $\left(\mathrm{PPh}_{3}\right)$ and diphosphine ligand (dppm) in the molar ratio of 1:2, and ammonium hexafluoride in the case of compound $b$, result in the mononuclear complexes $\left[\mathrm{Pd}\left\{2,3,4-(\mathrm{CHO}) \mathrm{C}_{6} \mathrm{H}_{3} \mathrm{C}(\mathrm{H})=\mathrm{NCy}\right\}\left\{\mathrm{PPh}_{3}\right\}[\mathrm{Cl}](\mathbf{1 a})\right.$ and $\left[\mathrm{Pd}\left\{2,3,4-(\mathrm{CHO}) \mathrm{C}_{6} \mathrm{H}_{3} \mathrm{C}(\mathrm{H})=\mathrm{NCy}\right\}\left\{\mathrm{Ph}_{2} \mathrm{PCH}_{2}\right.\right.$ $\left.\left.\mathrm{PPh}_{2}-\mathrm{P}, \mathrm{P}\right\}\right][\mathrm{PF} 6](\mathbf{1 b})$.

Keywords: cyclometallated; palladium; imine; X-ray diffraction

## 1. Introduction

The possible application of palladium compounds in medicine has become a particularly active and attractive study issue in bioinorganic and biological chemistry [1]. The use of chelating ligands in the development of physiologically active palladium compounds with improved kinetic stability is a well-established design principle [2]. Since the existence of a strong $\mathrm{Pd}-\mathrm{C}$ bond in the $[\mathrm{C}, \mathrm{N}]$ palladacycle enhances the stability of the organometallic complex, orthometallated N-donor ligands, such as imines, have been successfully employed for this purpose [3]. The nitrogen-donor ligands, palladacycles, are gaining popularity due to their numerous applications in organic synthesis, antitumoral drug synthesis, asymmetric synthesis, intermolecular aromatic $\mathrm{C}-\mathrm{H}$ bond activation, synthesis and reactivity of organometallic complexes with biologically important ligands, and drug delivery [3]. Therefore, we report herein the synthesis and characterization of cyclopalladated compounds of the general formula $\left[\mathrm{Pd}\left\{2,3,4-(\mathrm{MeO})_{3} \mathrm{C}_{6} \mathrm{HC}(\mathrm{H})=\mathrm{N}-\mathrm{R}\right\}\{\mathrm{R}=\mathrm{Cy}\right.$, $\left.2,4,6-\mathrm{MeC}_{6} \mathrm{H}_{2}\right\}(\mathrm{X}=\mathrm{Cl}, \mathrm{Br})$ ] with $\mathrm{PPh}_{3}$ and dppm ligands.

## 2. Result and Discussion

The treatment of the halogen-bridged ligand compound a with the $\mathrm{PPh}_{3}$ in the molar ratio of 1:2 produced a monomer palladium(II) compound with $\mathrm{PPh}_{3}$ ligand, and the treatment of compound $\mathbf{b}$ with the diphosphine dppm and $\mathrm{NH}_{4} \mathrm{PF}_{6}$ in a 1:2 molar ratio gave a monomer palladium(II) compound with phosphine chelated ligand (Scheme 1). The compounds were characterized by using ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ and ${ }^{1} \mathrm{H}$ NMR spectroscopy. In the ${ }^{1} \mathrm{H}$ NMR, the proton $\mathrm{H}(5)$ for compounds $\mathbf{1 a}$ and $\mathbf{1 b}$ appears as a doublet by coupling to ${ }^{31} \mathrm{P}$. A doublet resonance of $\mathrm{HC}=\mathrm{N}$ proton is coupled to ${ }^{31} \mathrm{P}$ nucleus trans to nitrogen for compound 1a at $8.26 \mathrm{ppm}\left[{ }^{4} J(\mathrm{PHi})=9.1 \mathrm{~Hz}\right]$ and for compound $\mathbf{1 b}$ at $8.20 \mathrm{ppm}\left[{ }^{4} J(\mathrm{PHi})=7.6 \mathrm{~Hz}\right]$. The $\mathrm{OMe}(\mathrm{C} 4) \mathrm{NMR}$ resonance for compounds $\mathbf{1 a}$ and $\mathbf{1 b}$ is shifted to a lower frequency due to the shielding effect of the phosphine's phenyl ring. The two inequivalent $\mathrm{OMe}(\mathrm{C} 4)$ groups have two different resonances in an antiparallel configuration, as one of them is not impacted by the phosphine's phenyl ring. In the ${ }^{31} \mathrm{P}-\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}$, a singlet ascribed to the coupling of compound 1a to the ${ }^{31} \mathrm{P}$ nucleus is shifted to a lower field ca. 43 ppm ,
which is consistent with a phosphorus trans to nitrogen arrangement. In contrast, for compound $\mathbf{1 b}$, the two inequivalent phosphorus nuclei are represented by two doublets at $-4.33[\mathrm{~d}, J=62.9 \mathrm{~Hz}]$ and $-27.53[\mathrm{~d}, J=62.9 \mathrm{~Hz}]$. The phosphorus nucleus trans to the phenyl carbon $C(6)$ has the lower-frequency doublet, while the phosphorus nucleus trans to the imine nitrogen has the higher-frequency doublet. This is predicated on the notion that a ligand with a higher trans influence shifts the phosphorus nucleus trans ${ }^{31} \mathrm{P}$ resonance to a lower frequency.

## 3. X-ray Diffraction

The mononuclear molecules (one molecule per asymmetric unit) are present in 1a (Figure 1) and $\mathbf{1 b}$, and a hexafluorophosphate anion is present in the case of the crystal structure $\mathbf{1 b}$ (Figure 2). The coordination sphere enclosing the palladium atom in the crystal structures $\mathbf{1 a}$ and $\mathbf{1 b}$ is formed by a nitrogen atom from the imine group, an ortho carbon atom from the phenyl ring ( C 1 ), a phosphor atom from a $\mathrm{PPh}_{3}$, a chlorine atom in the case of the crystal structure of $\mathbf{1 a}$, and two phosphorus atoms from a chelating dppm in the case of the crystal structure of $\mathbf{1 b}$. The Pd1-C1, which is $2.027(5) \AA$ for $\mathbf{1 a}$ and $2.036(3) \AA$ for $\mathbf{1 b}$, is in agreement with the partial multiple-bond character of the $\mathrm{Pd}-\mathrm{C}$ bond [4]. The $\mathrm{Pd}(1)-\mathrm{N}(1)$ bond length, which is $2.112(5) \AA$ for $\mathbf{1 a}$ and $2.096(2) \AA$ for $\mathbf{1 b}$, is longer than the single bond predicted value of 2.011, which has an impact on the phosphine ligand's trans effect [5]. It can be noticed in that there is an intermolecular interaction for compound 1 b , resulting in a $\mathrm{C}_{\text {sp } 3} \cdots \mathrm{H} \cdots \mathrm{C}$ weak interaction. The bond and angel interaction $\mathrm{C} 38 \cdots \mathrm{H} 10 \cdots \mathrm{C} 10$ are $2.838 \AA$ and $113.36^{\circ}$, respectively, and the C $38 \cdots$ C10 bond interaction is $3.331 \AA$ (Figure 3). Table S1 lists specifics regarding the structure's refinement and the final reliability factors.

## 4. Experimental Part

Compounds $\mathbf{a}$ and $\mathbf{b}$ were prepared in the same manner [6].

### 4.1. Synthesis of $\left[P d\left\{2,3,4-(\mathrm{MeO})_{3} \mathrm{C}_{6} \mathrm{HC}(\mathrm{H})=\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{2}\right\}\left\{\mathrm{PPh}_{3}\right\}\right]$. (1a)

A total of ( $25 \mathrm{mg}, 0.029 \mathrm{mmol}$ ) of compound a was added to acetone $\left(10 \mathrm{~cm}^{3}\right)$. The required quantity of triphenylphosphine was added (in a 1:2 molar ratio) and the mixture was agitated for 3 h at room temperature. The solution was reduced to a low volume, and the solid was recrystallized from dichloromethane/n-Hexane and dried in vacuo. The yield was $50 \%$. IR $\left.=v(\mathrm{C}=\mathrm{N}) 1569 \mathrm{~cm}^{-1}, v(\mathrm{Pd}-\mathrm{Cl}) 298 \mathrm{~cm}^{-1} . \mathrm{NMR}^{1} \mathrm{H}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)\right) \delta 8.26$ $\left(\mathrm{d},{ }^{4} J(\mathrm{PHi})=9.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Hi}\right), 7.67\left(\mathrm{t},{ }^{3} J(\mathrm{HH})=7.6 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{PPh}_{3}\right), 7.35\left(\mathrm{t},{ }^{3} J(\mathrm{HH})=7.6 \mathrm{~Hz}\right.$, $\left.3 \mathrm{H}, \mathrm{PPh}_{3}\right), 7.29\left(\mathrm{~d},{ }^{3} \mathrm{~J}(\mathrm{HH})=7.6 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{PPh}_{3}\right), 5.65\left(\mathrm{~d},{ }^{4} \mathrm{~J}(\mathrm{H} 5 \mathrm{P})=6.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H} 5\right), 4.33(\mathrm{~m}$, $\left.{ }^{3} \mathrm{~J}(\mathrm{HH})=11.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{N}-\mathrm{CH}-\mathrm{Cy}\right), 3.86(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OMe}), 3.61$ (s,3H,OMe), 2.72 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{OMe}$ ), 2.17-0.79 (m, 10H, Cy) (Figure S1). ${ }^{31} \mathrm{P}$ NMR ( $\delta \mathrm{ppm}, \mathrm{CDCl}_{3}$ ) $\delta 42.86$.

### 4.2. Synthesis of $\left.\left[P d\left\{2,3,4-(\mathrm{MeO})_{3} \mathrm{C}_{6} \mathrm{HC}(H)=N-2,4,6-\mathrm{Me}_{3} \mathrm{C}_{6} \mathrm{H}_{2}\right\} \mathrm{Ph}_{2} \mathrm{PCH}_{2} \mathrm{PPh}_{2}-\mathrm{P}, \mathrm{P}\right\}\right]\left(\mathrm{PF}_{6}\right)$. (1b)

A total of ( $25 \mathrm{mg}, 0.025 \mathrm{mmol}$ ) of compound $\mathbf{b}$ was added to acetone $\left(10 \mathrm{~cm}^{3}\right)$. The appropriate amounts of dppm and $\mathrm{NH}_{4} \mathrm{PF}_{6}$ were added in a molar ratio of (1:2), and the mixture was stirred for 3 h at room temperature. The orange precipitate formed was filtered off, recrystallized from dichloromethane/n-Hexane, and dried in vacuo. The yield was $85 \%$. $\mathrm{IR}=v(\mathrm{C}=\mathrm{N}) 1565 \mathrm{~cm}^{-1} . \mathrm{NMR}{ }^{1} \mathrm{H}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.20\left(\mathrm{~d},{ }^{4} \mathrm{~J}(\mathrm{PHi})=7.6 \mathrm{~Hz}, 1 \mathrm{H}\right.$, $\mathrm{Hi}), 8.06-6.99\left(\mathrm{~m}, 20 \mathrm{H}, \mathrm{PPh}_{2}\right), 6.68\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{Ha}, \mathrm{Ha}^{\prime}\right), 6.03\left(\mathrm{dd},{ }^{4} \mathrm{~J}\left(\mathrm{H} 5 \mathrm{P}_{\text {trans }}\right)=10.4 \mathrm{~Hz},{ }^{4} \mathrm{~J}\right.$ $\left.\left(\mathrm{H}_{5} \mathrm{P}_{\mathrm{cis}}\right)=7.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H} 5\right), 4.27\left(\mathrm{dd},{ }^{2} \mathrm{~J}(\mathrm{HP})=12.0,8.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{PCH}_{2} \mathrm{P}\right), 3.99(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OMe})$, 3.79 (s, 3H, OMe), 3.17 (s, 3H, OMe), 2.25 (s, 3H, Me), 2.18 (s, 6H, Me ${ }^{*}$ ) (Figure S2). ${ }^{31} \mathrm{P}-\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, \delta \mathrm{ppm}\right)-6.0[\mathrm{~d}, J=66.5],-30[\mathrm{~d}, J=66.5],-141\left[\mathrm{~h}, \mathrm{PF}_{6}{ }^{-}\right]$.
