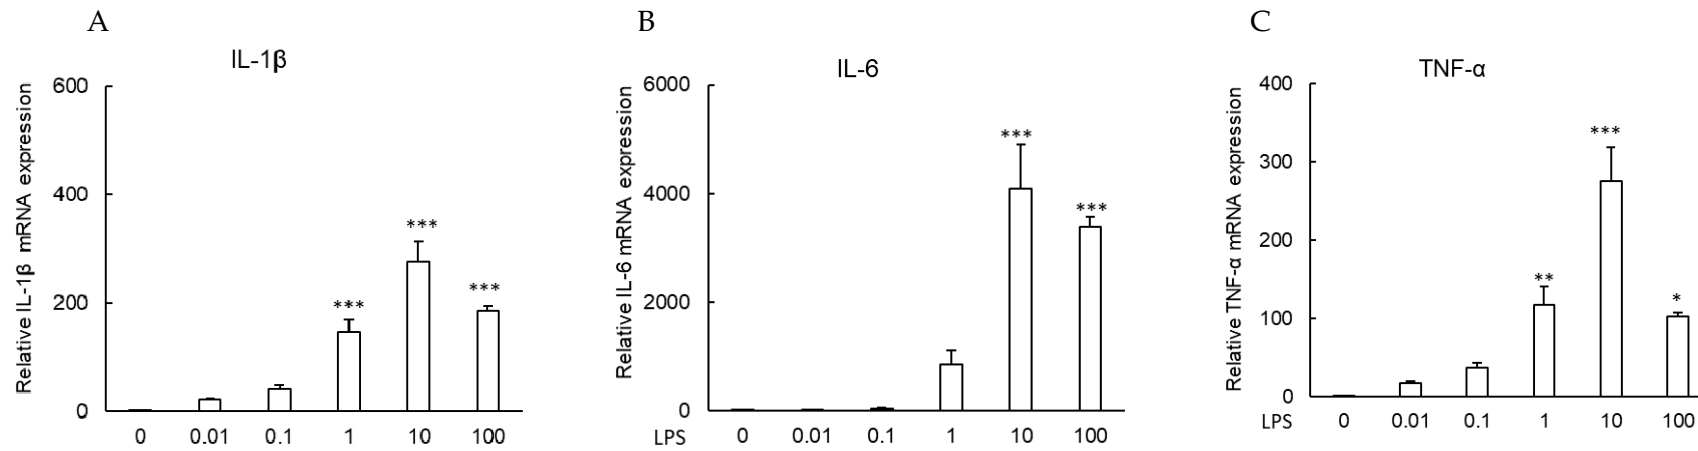

Figure S1. Effects of LPS treatment on astrocytic production of proinflammatory cytokines. (a-c) Astrocytes ($n=4$) were treated with LPS (0-100 ng/ml) for 3 hours. Control values in (a-c) were obtained in the absence of LPS. The results are presented as means \pm SEMs. Data were analyzed by one-way ANOVA with Tukey's *post-hoc* test and $*p < 0.05$ versus control cells.
