Message from the Guest Editors

Dear Colleagues,

A major function of space propulsion systems is to accelerate spacecraft by producing a propulsive force (thrust) or a change in velocity (delta-V) by ejecting propellant mass at a high speed into the air or space based on Newton's laws of motion. This plays an important role in acceleration, attitude control, drag make-up, and orbit transfer maneuvers of spacecraft. The various types of space propulsion systems can be defined depending on what kind of energy source is used and how the energy is generated to provide thrust. At present, chemical and electric propulsion systems are the preferred types of systems for various spacecrafts. Applications of space propulsion can be classified into three different categories: escape propulsion (from Earth's surface to its orbit), in-space propulsion (in Earth's orbit), and deep space propulsion (from Earth's orbit to outer space).

This Special Issue invites contributions relating to recent advances and challenges for space propulsion technologies. Submissions welcome a whole range of space propulsion topics.

an Open Access Journal by MDPI

Message from the Editor-in-Chief

You are welcome to contribute a research article or a comprehensive review for consideration and publication in *Aerospace* (ISSN 2226-4310), an on-line, open access journal.

Aerospace adheres to rigorous peer-review as well as editorial processes and publishes high quality manuscripts that address both the fundamentals and applications of aeronautics and astronautics. Our goal is to enable rapid dissemination of high impact works to the scientific community.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within [Scopus](#), [SCIE \(Web of Science\)](#), [Inspec](#), and [other databases](#).

Journal Rank: JCR - Q1 (*Engineering, Aerospace*) / CiteScore - Q2 (*Aerospace Engineering*)
