The in-depth knowledge of the mechanisms of plant defense response to pathogens will be able to allow the development of crop protection strategies based on the induction of effective defense responses in disease control. To this end, research on different substances to be used as resistance inductors, to improve the plant defense response, is really important. This could allow higher and faster synthesis of phytoalexins, and/or other defense compounds, in growth stages in which the pathogen is more virulent, providing a real contribution in disease control. Similarly, the objective of environmentally friendly and sustainable control can be achieved by using biological and natural products instead of chemical applications. Therefore, this Special Issue aims to collect articles from both themes mentioned which have in common the objective of avoiding or reducing the use of chemical plant protection products.

# Message from the Editor-in-Chief

Agronomy draws together researchers from diverse areas of agricultural research with a common aim of enhancing agricultural productivity globally. The journal provides unlimited free access to all those interested in advancing agricultural science from both the research and general community. Papers are released immediately after acceptance through the internet. Agronomy is supported by our authors and their institutes through low article processing charges (APC) for accepted papers. We hope you will support the journal by becoming one of our authors

### **Author Benefits**

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High Visibility:** indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, and other databases.

Journal Rank: JCR - Q1 (Agronomy) / CiteScore - Q1 (Agronomy and Crop Science)
