Message from the Guest Editors

Dear Colleagues,

Authors are invited to deal with all aspects of the role of the anatomy under a historical, modern and integrated perspective. This is expected to be provided through specific narration and experimental works witnessing how anatomy was and will be fundamental in life sciences. Being aware that the future of anatomy relies on the prestigious roots of its history, and considering the important contribution of morphological studies for the advancement of medicine, Anatomia is launching this Special Issue to provide a broad view on this topic and stimulate a holistic and humanistic perspective, taking into account the connection between the history of anatomy and its recent advances. On the pretext of the Renaissance revolution, any kind of article showing how modern anatomical approaches represent a natural evolution of this ancient discipline is within the scope of this issue. Research articles and critical reviews are accepted, with no length restrictions.
