Message from the Guest Editor

Dear Colleagues,

In the past decade, the advancement of next-generation sequencing technologies has produced a large number of different types of omics data, such as genomics, transcriptomics, radiomics, metabolomics, epigenomics, etc. More systematic ways to collect and store health and disease information from patients can also accumulate tons of informatics. The characterization of diseases, as well as patients, has never been so detailed. For example, the development of radiomics can extract far more disease information that is not visible to doctors.

In order for biomedical data to be manipulated appropriately, and for physicians and researchers to have a rule of thumb to follow, *Biomedinformatics* introduces this Special Issue. We encourage contributions to the development and applications of bioinformatics and statistical methods in the context of biomedicine. Original studies, as well as insightful reviews, are very welcome to be published under this Special Issue.
