## Synthesis and Applications of Carbon-based Catalysts

Guest Editors:

## Dr. Luisa Maria Gomez-Sainero

Departamento de Ingeniería Química, Facultad de Ciencias, Universidad Autónoma de Madrid, Cantoblanco, 28049 Madrid, Spain

## Dr. María Martín Martínez

Chemical Engineering Department, Universidad Autónoma de Madrid, 28049 Madrid, Spain

Deadline for manuscript submissions: closed (31 July 2021)

## Message from the Guest Editors

Carbon-based materials are employed in many catalytic processes, either as supports or as metal-free catalysts by themselves. Their porosity and surface chemistry are easily tunable, enabling the rational design of carbon-based catalysts, making them suitable for many different catalytic applications, from fine chemical synthesis tο environmental processes or the production of energy. Activated carbons, graphitized materials (e.g., carbon xerogels), and several carbon nanostructures, such as carbon nanotubes and nanofibers or graphene, are included among the most common carbon materials used in these sorts of applications.

In this Special Issue, we invite authors to submit original articles and reviews on the synthesis and applications of carbon-based materials in the catalysis.
