Message from the Guest Editor

Dear Colleagues,

The vertebrate eye is a highly specialized sensory organ resulting from structures derived from the neural tube called optic vesicles. During embryogenesis, ocular development is controlled by several intracellular and extracellular signaling pathways. These signaling pathways play essential roles in several developmental processes, including cell proliferation and cell fate determination. While the activity of these pathways is tightly controlled during development, dysregulation can result in multiple ocular malformations. Furthermore, faulty regulation of several signaling pathways has been associated with ocular pathologies in post-natal life. This Topic will highlight the role of several key signaling pathways involved in eye development and how their dysregulation contributes to ocular diseases.

Copenhagen, Copenhagen,
Denmark

Message from the Editorial Board

Cells has become a solid international scientific journal that is now indexed on SCIE and in other databases. We have successfully introduced a special issues format so that these issues serve as mini-forums in specific areas of cell science. *Cells* encourages researchers to suggest new special issues, serve as special issues editors, and volunteer to be reviewers. Our main focus will remain on cell anatomy and physiology, the structure and function of organelles, cell adhesion and motility, and the regulation of intracellular signaling, growth, differentiation, and aging. We are open to both original research papers and reviews.

Author Benefits

Open Access: free for readers, with [article processing charges \(APC\)](#) paid by authors or their institutions.

High Visibility: indexed within [Scopus](#), [SCIE \(Web of Science\)](#), [PubMed](#), [MEDLINE](#), [PMC](#), [CAPus / SciFinder](#), and [other databases](#).

Journal Rank: JCR - Q2 (*Cell Biology*) / CiteScore - Q1 (*General Biochemistry, Genetics and Molecular Biology*)
