Message from the Guest Editor

Dear Colleagues,

Hirschsprung Disease (HSCR) is a rare condition affecting the motility of the enteric system and resulting in obstruction of the bowel. Its most severe form, Total Colonic Aganglionosis (TCA), occurs in 2–5 % of all children with HSCR.

At the OASIS Symposium, clinicians, researchers and patients (representatives) from all over Europe will work together on a holistic approach to care.

There will be a particular focus on:

- Patients and Family needs before and after surgery;
- Patient support groups for Hirschsprung's Disease in Europe as well as ideas for cross-collaboration;
- Diagnostic pathways;
- Surgical Strategies in Hirschsprung' Disease and total colonic aganglionosis;
- Optimal bowel management;
- Holistic Continence Score;
- Nutrition and Microbioma;
- Quality of life aspects; longitudinal follow up;
- Transition of care.

More information please contact us:
