Deadline for manuscript submissions:  
**closed (10 March 2024)**

### **Message from the Guest Editors**

Significant progresses have been observed in the field of diagnosis and treatment of pediatric cancers in recent decades. Notably, in recent years, new techniques have been incorporated into the armamentarium of surgeons dealing with pediatric cancer patients. In particular, laparoscopic- and robotic-assisted surgery have carved their space in the adult cancer population with evidence supporting less pain, shorter hospital stays, lower complications, and equivalent long-term survival and oncologic outcomes; and hopefully they may have a role in pediatric cancer surgery as well. In addition, the improvement in the quality imaging has allowed a three-dimensional visualization and printing to be incorporated into surgical practice, and fluorescence-guided surgery showed the advantage to distinguish anatomical or physiologic differences between cancer and normal tissue.

This Special Issue aims to discuss advances in diagnosis and surgical care of cancers in pediatric age. Colleagues and researchers are invited to submit their manuscripts.

We look forward to receiving your valuable contributions.
