Message from the Guest Editors

Dear Colleagues,

Pediatric gastrointestinal tract disorders represent an extremely large and diverse set of disorders. The pathological entities that can be considered in this group vary in nature and frequency among the various age groups of the pediatric patient, and may be congenital or acquired. The pathological entities that can be considered in this group vary in nature and frequency among the various age groups of the pediatric patient. Among the former, an important role is played by malformed pathologies such as esophageal atresia or such as Hirschsprung's disease, not forgetting abnormalities of the lower digestive tract such as, anorectal malformations. Among acquired diseases, on the other hand, we can give several examples, but in terms of frequency and severity, acute appendicitis, volvulus of the intestine, and necrotizing enterocolitis (NEC) are worth mentioning. In this Special Issue, we want to give space to all colleagues who want to share their experiences regarding the diagnosis, management, and surgical treatment of pediatric gastrointestinal diseases.
