Message from the Guest Editors

Dear Colleagues,

Medical, surgical, and public health innovations have changed the epidemiology of health among neonates, infants, and children. Pediatric patients are more complex because of advances in treatments for acute and chronic health conditions. The changing landscape of health and complexity of pediatric patients extends to the fields of anesthesiology and perioperative and pain medicine. This Special Issue seeks to publish interdisciplinary research that explores the current and future directions of pediatric anesthesiology and perioperative and pain medicine in critical areas of medical practice that have and will continue to shape this field for years to come. We welcome manuscripts that consider the increasing complexity of children requiring anesthesiology and pain and perioperative medicine with a focus on recent evidence-based innovations, technologies, and changes to care paradigms that respond to the evolving landscape of health among children. Literature reviews, original research, and other important commentaries that highlight this work are welcome.
