### Message from the Collection Editor

Dear Colleagues,

This topical collection focuses on molecular basis and molecular interactions involved in the development and progression of human diseases, as well as novel molecular biomarkers which could be suitable for diagnosis, prognosis and targeted therapies. Original research articles, reviews and short communications which fit the scope of the Topical Collection are welcome.

Identifying novel molecular mechanisms might help to implement cost effective early prevention and treatment. In the last decades, the identification of molecular mechanisms associated with specific human diseases led to the development of a number of novel drugs characterized by reduced side effects.

In this topical collection, we expect papers on the molecular mechanisms and interactions that comprehensively regulate cellular functions in human diseases, including but not limited to cell proliferation, growth, survival, death, inflammation and signaling observed in human pathological conditions. Studies on the molecular and cellular therapy of human diseases are also welcome.
