Message from the Guest Editor

Dear Colleagues,

Climate change is causing an increase in the development of extreme atmospheric events with catastrophic effects in many regions of the world. Atmospheric circulation alterations cause the genesis of episodes on temperature, precipitation, and wind extraordinary range. This Special Issue deals with the effects of climate change on the formation of extreme atmospheric events, its recent evolution, its trends, and the forecast projections for the future. These are events that generate a significant socio-economic impact on various territories, highlighting the need to understand their present and future effects of the implementation of adaptation measures.
