Message from the Guest Editors

Diseases affecting the orofacial complex are among those with the highest prevalence and thus make it a healthcare issue. There is strong evidence that most oral health conditions are largely preventable and can be easily treated in their early stages. Preventive dentistry is concerned with caries, periodontal disease, oral cancer and other relevant conditions that affect the oral cavity and its related structures. In recent decades, patients with different general health problems have increased significantly, requiring specific treatments and increasing even more the importance of prevention and effective treatments.
