Message from the Guest Editor

Photocatalytic materials have been the subject of extensive studies in the last decade due to their unique properties such as promoted catalysis, adsorption surface, and high reactivity in mild conditions. This Special Issue is devoted to exploring and highlighting the relationships between the structure, morphological and optical properties, and the features of photocatalysts and photoactivity.

The synthetic procedures, including doping, semiconductor coupling, and surface coating, can noticeably affect the physicochemical properties of semiconductors.

In this Special Issue, frontier researchers and colleagues are invited to present original papers and review articles involving (without being limited to) the topics listed below:

- materials for photocatalytic water and wastewater treatment
- materials for sustainable photocatalytic synthesis
- materials for photocatalysis under visible light
- materials for CO₂ photoreduction
- materials for air purification
- materials for bacterial photoinactivation
