Message from the Guest Editors

Pediatric heart failure is a serious and often life-threatening condition in which the heart is no longer able to pump enough blood to meet the body's needs. Some of the most common causes of heart failure in children and adolescents include congenital heart defects, cardiomyopathy, infections, arrhythmia, pulmonary hypertension, and genetic disorders. Since heart failure has different causes and outcomes, it is important to recognize how it is diagnosed, treated, and even cured in younger children.

This joint Special Issue on pediatric heart failure aims to provide a comprehensive overview of the latest research and clinical practices in the field and highlights the ongoing efforts to improve outcomes for children with this complex and challenging condition. Contributions related to all aspects of these topics are welcome.
