Message from the Guest Editors

Dear Colleagues,

Tremendous advancements have been made to effectively combat various malignant diseases in the past few decades. Early detection and monitoring with a battery of biomarkers and targeted therapy with various molecular inhibitors are emerging continuously to increase our strength to continue our fight against cancer. On the other hand, various preventive measures such as HPV vaccination and mammographic imprinting have remarkably improved our ability to prevent or detect cancer early. Various mitochondria- and exosome-based therapeutic approaches in concert with next generation immunotherapy are also on the way to develop comprehensive measures to conquer this lethal disease. In this Special Issue, we would like to invite cutting-edge research covering the broad areas of preventive and therapeutic oncology.
