Message from the Guest Editors

Marine mammals are uniquely adapted species and sentinels of the ocean. A growing body of knowledge exists on marine mammal health and disease, but a knowledge gap remains. Innovations in medicine expand this knowledge base and provide additional tools to both inform and improve the welfare and wellbeing of marine mammals worldwide.

This Special Issue on “Marine Mammal Health” of the *Oceans* journal seeks original contributions in the field of all disciplines relating to marine mammal health, disease and medicine. The aim of this Special Issue is to address relevant topics that improve marine mammal health. Topics relevant to this Special Issue include but are not limited to marine mammal health, disease, medicine, physiology, conservation, and One Health. Articles on topics of interest to clinicians, scientists, policymakers, and the general public will be considered for publication.
