Message from the Guest Editor

Dear Colleagues,

Operative office hysteroscopy is an essential part of gynecologic practice. Hysteroscopy is a relatively safe procedure. However, as with any type of surgery, complications are possible. With hysteroscopy, complications occur in less than 1% of cases. Interest in the field of hysteroscopy is continuously increasing. We believe that there is a need for an update in hysteroscopy, safer and improve the effectiveness of hysteroscopy in the diagnosis and treatment of intrauterine pathologies. This Special Issue focuses on recent advances in hysteroscopy.
