GIS Solutions and Remote Sensing Applications in Monitoring, Assessing and Managing Different Aquatic and Glaciated Environments

Guest Editors:

Dr. Hao Zhang

Laboratory for Applied Earth Observation and Spatial Analysis (LAEOSA), Department of Environmental Science and Engineering, Fudan University, Shanghai, China

Dr. Rui Zhou

School of Environmental and Geographical Sciences, Fudan University, Shanghai, China

Dr. Yuanbin Cai

College of Environment and Safety Engineering, Fuzhou University, Fuzhou, China

Deadline for manuscript submissions:

closed (25 April 2024)

Message from the Guest Editors

Dear Colleagues,

The dynamics of different aquatic and glaciated environments determine the status of water supply and related risks (e.g., drought, fire, flood, and hill slide) worldwide, and profoundly influence the functionality and health of ecosystems and the sustainability of human life. Unfortunately, intensive human activities amplify the impacts of climate change. Across local, regional, and global scales, the science and technology of GIS and remote sensing can provide useful tools for mapping, monitoring, and assessing the combined effects of climate change and human activities on aquatic and glaciated environments. However, given the complexity and uncertainty of human–nature interactions, the routine theories and methods reported in previous studies may not be sufficient to understand the changing world. Therefore, in this Special Issue, state-of-the-art GIS and remote sensing theories and technologies geared towards monitoring, assessing, and managing different aquatic and glaciated environments, particularly multidisciplinary collaborative simulations, machine learning algorithms, multiple dataset combinations, and data assimilation are welcome.

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), Ei Compendex, GEOBASE, GeoRef, PubAg, AGRIS, CAPlus / SciFinder, Inspec, and other databases.

Journal Rank: JCR - Q2 (*Water Resources*) / CiteScore - Q1 (*Water Science and Technology*)
