## Ecosystem-Based Understanding and Management of Eutrophication

Guest Editors:

**Prof. Emeritus William D. Taylor**

Department of Biology, University of Waterloo, Canada

**Prof. Dr. Xiufeng Zhang**

Department of Ecology and Institute of Hydrobiology, Jinan University, China

Deadline for manuscript submissions:

**closed (31 March 2022)**

### Message from the Guest Editors

Anthropogenic eutrophication leads to anoxia and excessive algal and plant biomass, including harmful algal blooms, and is one of the most common water quality problems in aquatic ecosystems worldwide. Important consequences include loss of ecosystem services and loss of biodiversity. Nutrients derived from human activity are key in driving it. However, an array of other human causes such as overfishing, land use changes, habitat alteration, and damming and other hydrological manipulations also may be important in many instances. Increasingly, protracted internal loading of P, introduced species, and climate change are the focus of research into the cause of degradation and loss of ecosystem services, especially when reductions in loading fail to cause or sustain the expected recovery of damaged ecosystems.

In this Special Issue, we wish to promote a holistic, ecosystem-based understanding and management of eutrophication and associated effects on water quality. We encourage contributions discussing results from field studies, experiments, models, and theoretical analyses that can provide insight into the management of this threat to humans and the biosphere in which they live.

and Environment, Centre  
National de la Recherche  
Scientifique (CNRS), University of  
Toulouse, Campus ENSAT,  
Auzeville Tolosane, France

## Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

## Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High Visibility:** indexed within Scopus, SCIE (Web of Science), Ei Compendex, GEOBASE, GeoRef, PubAg, AGRIS, CAPlus / SciFinder, Inspec, and other databases.

**Journal Rank:** JCR - Q2 (*Water Resources*) / CiteScore - Q1 (*Water Science and Technology*)
